Ge SLS

Notwithstanding Ribeiro's explicit assertion that the Krahô' of 1816 did not know how to raise or treat cotton, it seems to me to have been native to all Northwestern and Central Gê before the advent of civilization. In the first place, cotton is employed in a variety of ways—in wholly aboriginal forms of industry as well as in ceremonial, notably in the boys' initiation festival. A second argument is the technique of plaiting cotton carrying slings for children, though it must be admitted that according to Ribeiro[10] their material was burity bast. Third, there is the form of the spindle, deviating from the neighboring Neobrazilian and Guajajára parallels (pl. 18, *a*); finally, all the Northwestern tribes share the same word for cotton.

Ethnographically, however, the kupá is the most important of Timbira cultivated species. This creeper (*Cissus* sp.) has starchy tendrils, which attain the thickness of an inch and are baked in earth ovens. It does not occur wild; is restricted, so far as my information goes, to the Eastern and Western Timbira and the Serénte, all of them Gé tribes; and is pronouncedly xerophil. Accordingly, it is probably a very old cultivated species peculiar to these tribes, which could not have borrowed it from either Neobrazilians or any of their present Indian neighbors.

As for tobacco, my corresponding comment on it among the Apinayé also holds for the Eastern Timbira. Apparently they were *acquainted* with it before the coming of civilization, but even nowadays they do not plant it, the timid attempts of this or that Rąmkõ'kamekra having invariably failed to yield satisfactory results. I did not observe a single case of its magical or ceremonial use among these people. Both sexes, however, are passionate smokers and constantly beg for tobacco. They smoke cigarettes of maize husks or tauary bast; a few also use little clay pipe bowls bent at an angle, with bamboo stems (kačím; Portuguese, caximbo). The chief Kukrãčą' manufactures very pretty and neatly finished specimens, partly for sale to Neobrazilians, among whom the same form is in vogue.

Urucú and pepper shrubs, as well as sporadic *Crescentia*, mango, lemon or orange trees, are planted beside or behind dwellings, the young plants being guarded against roving pigs and fowls by little fences of vertically set sticks or by circumscribed quadrangles made of former racing logs.

The true plantations (pl. 5, *a*) are situated in the narrow *galeria* forests by the brooks. Since annually new clearings are necessary, the distance of the plots from the village steadily increases. When the transportation of the crops becomes altogether too cumbersome, the Indians are obliged to move their village near the new plots. Thus, the Rąmkõ'kamekra migrate with fair regularity about every ten years from the Ribeirão Santo Estevão to the Ribeirão dos Bois. While they are stationed by one of the two creeks for from ten to twenty years, the timber of the other grows again sufficiently to permit the creation of new plots.

Each individual family has its plantation, owned by the woman. No single man owns a plot, but many an unmarried woman claims one and gets her kinsmen to make the requisite clearings, this being an exclusively masculine task. For the last hundred years only iron axes have been in use, different brands being very well distinguished by the natives, who rightly prefer the North American "Collins" blades. No one nowadays is able to haft such stone blades as are still occasionally found. The method of felling timber with iron tools coincides with Neobrazilian practice. Though not every Indian has a good ax suitable for the purpose, he may borrow a relative's.

The several plots belonging to the married woman of an extended family usually, but not always, adjoin one another. At times one individual family may simul-
